Assignment 1: LPA Kernels

A. Foi, *Anisotropic nonparametric image processing: theory, algorithms and applications*, Ph.D. Thesis, Dip. di Matematica, Politecnico di Milano, April 2005.

Lez21_A_LPA

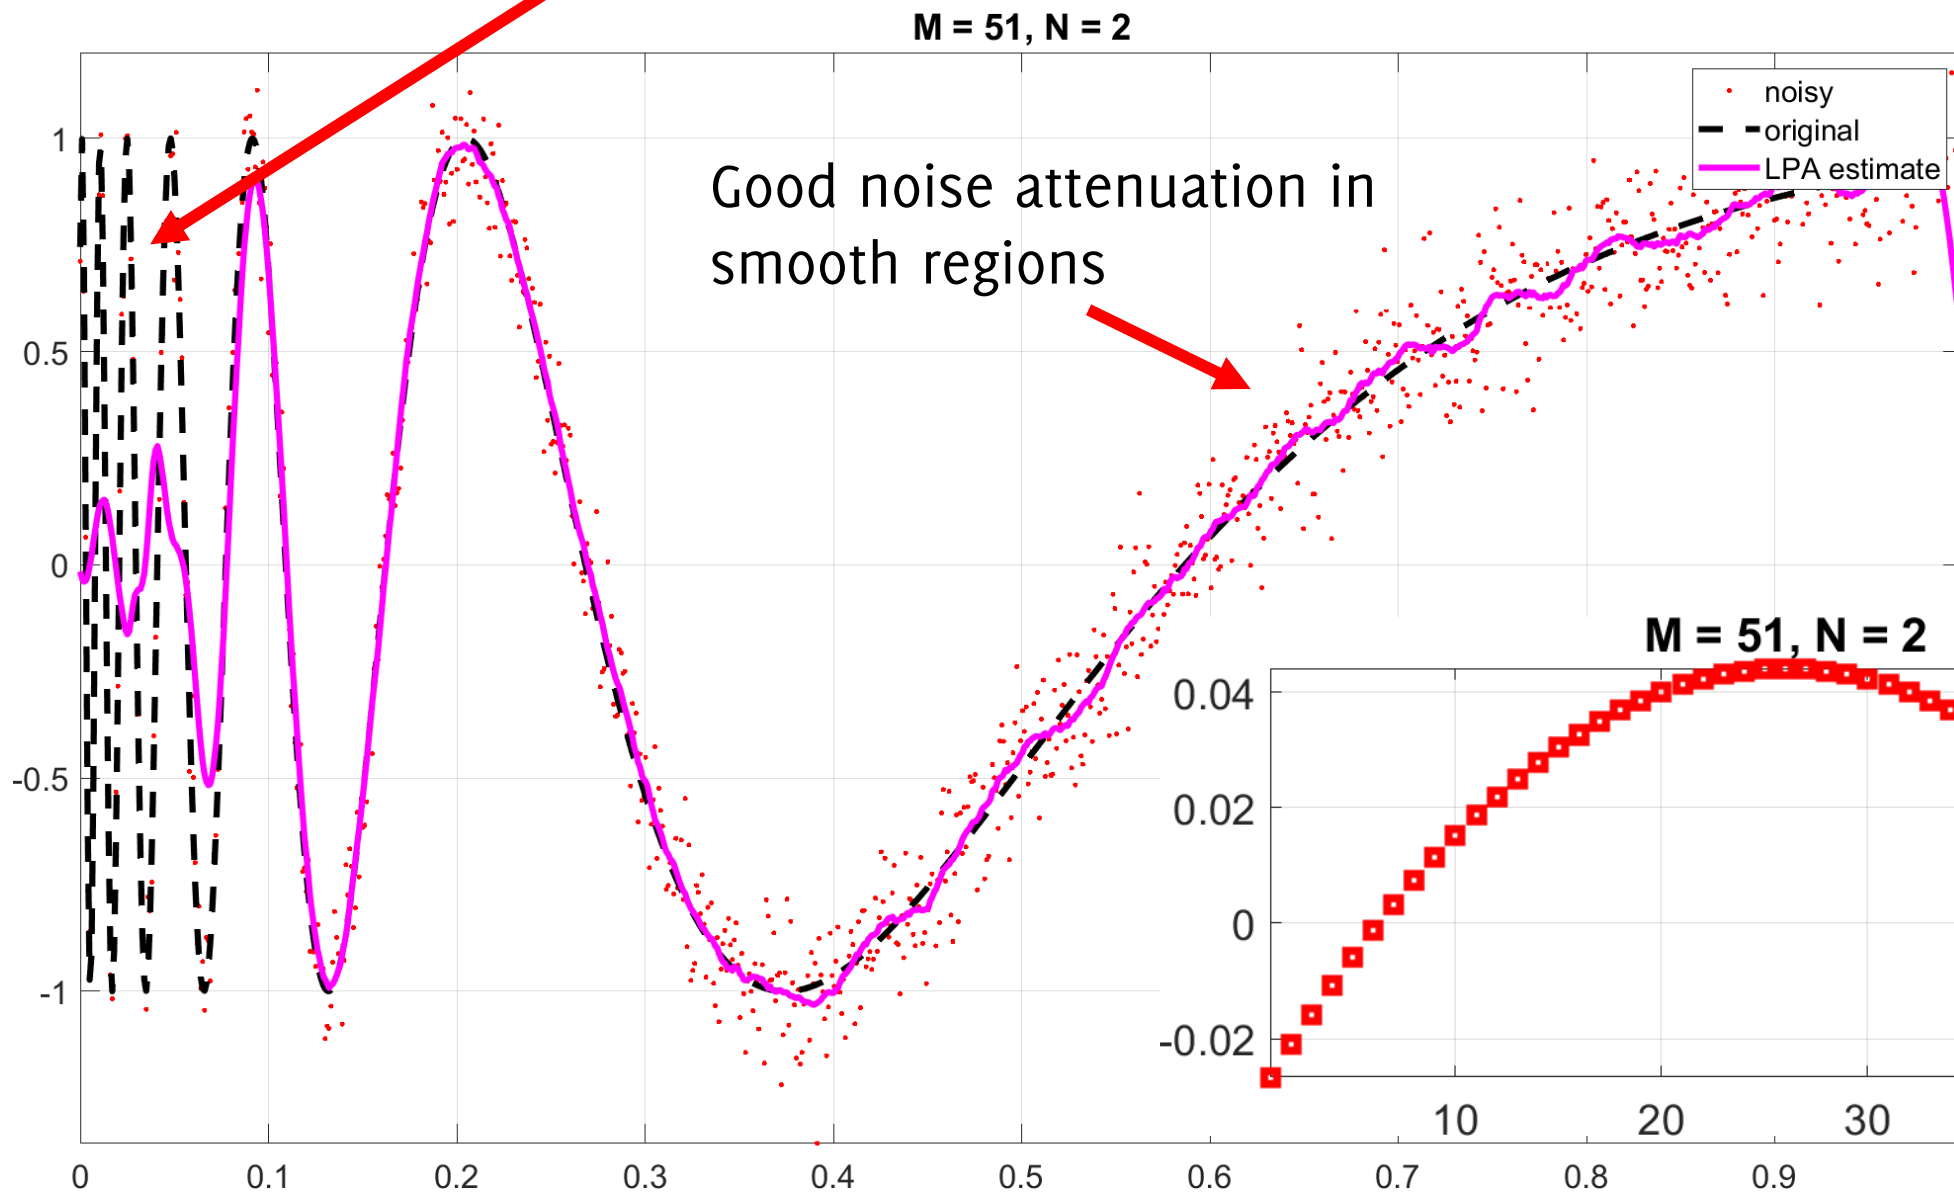

Define the LPA filters for a given polynomial order N and over a fixed support M to perform regression over noisy signals

Noisy Signal

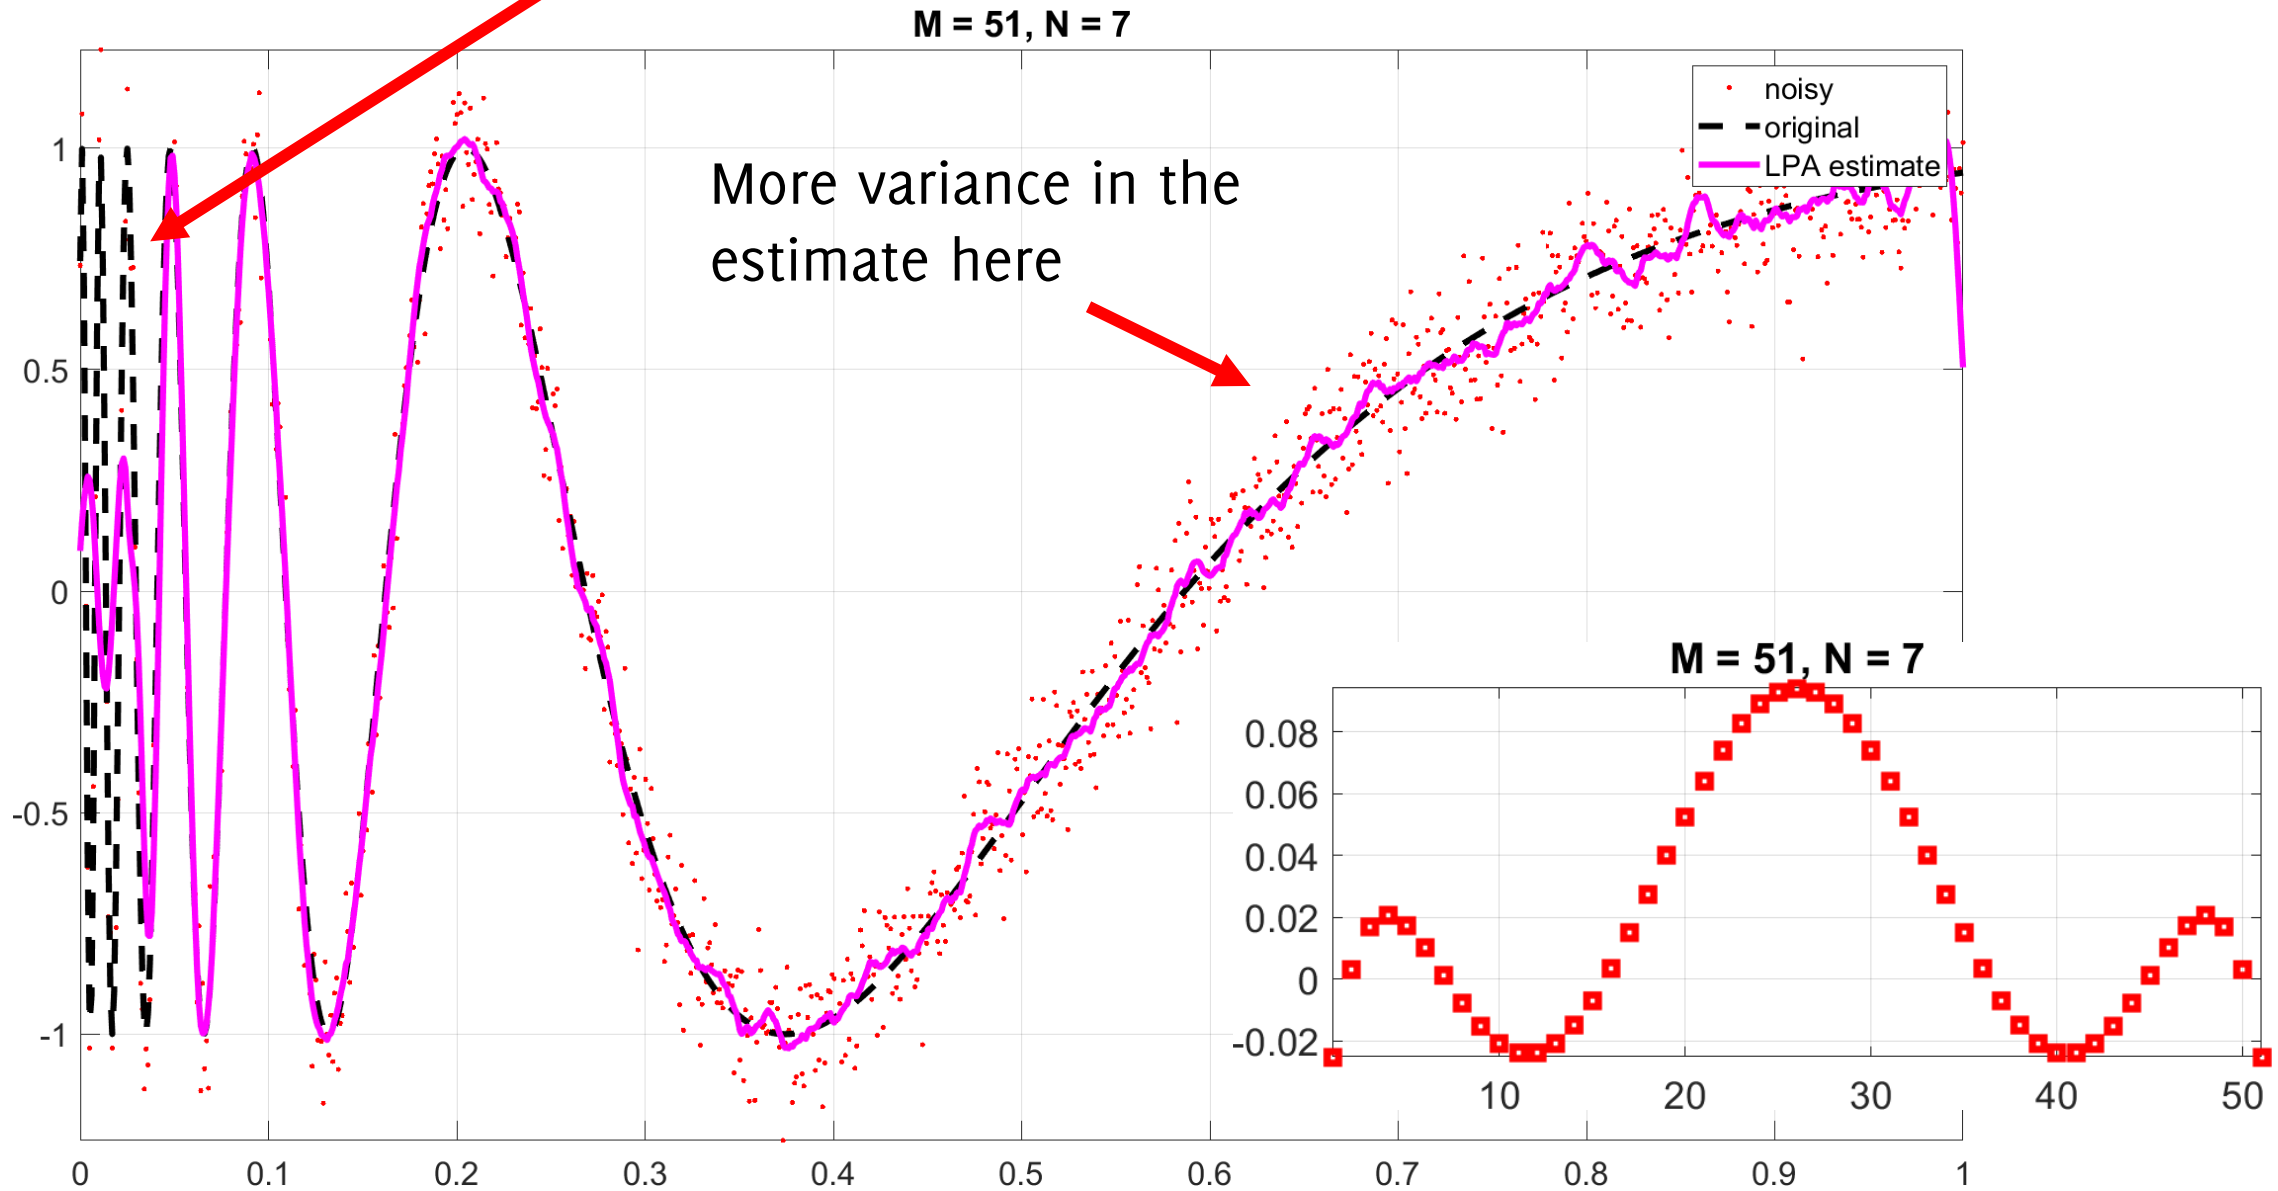

Large M , small N

Biased estimate when the signal frequency is high

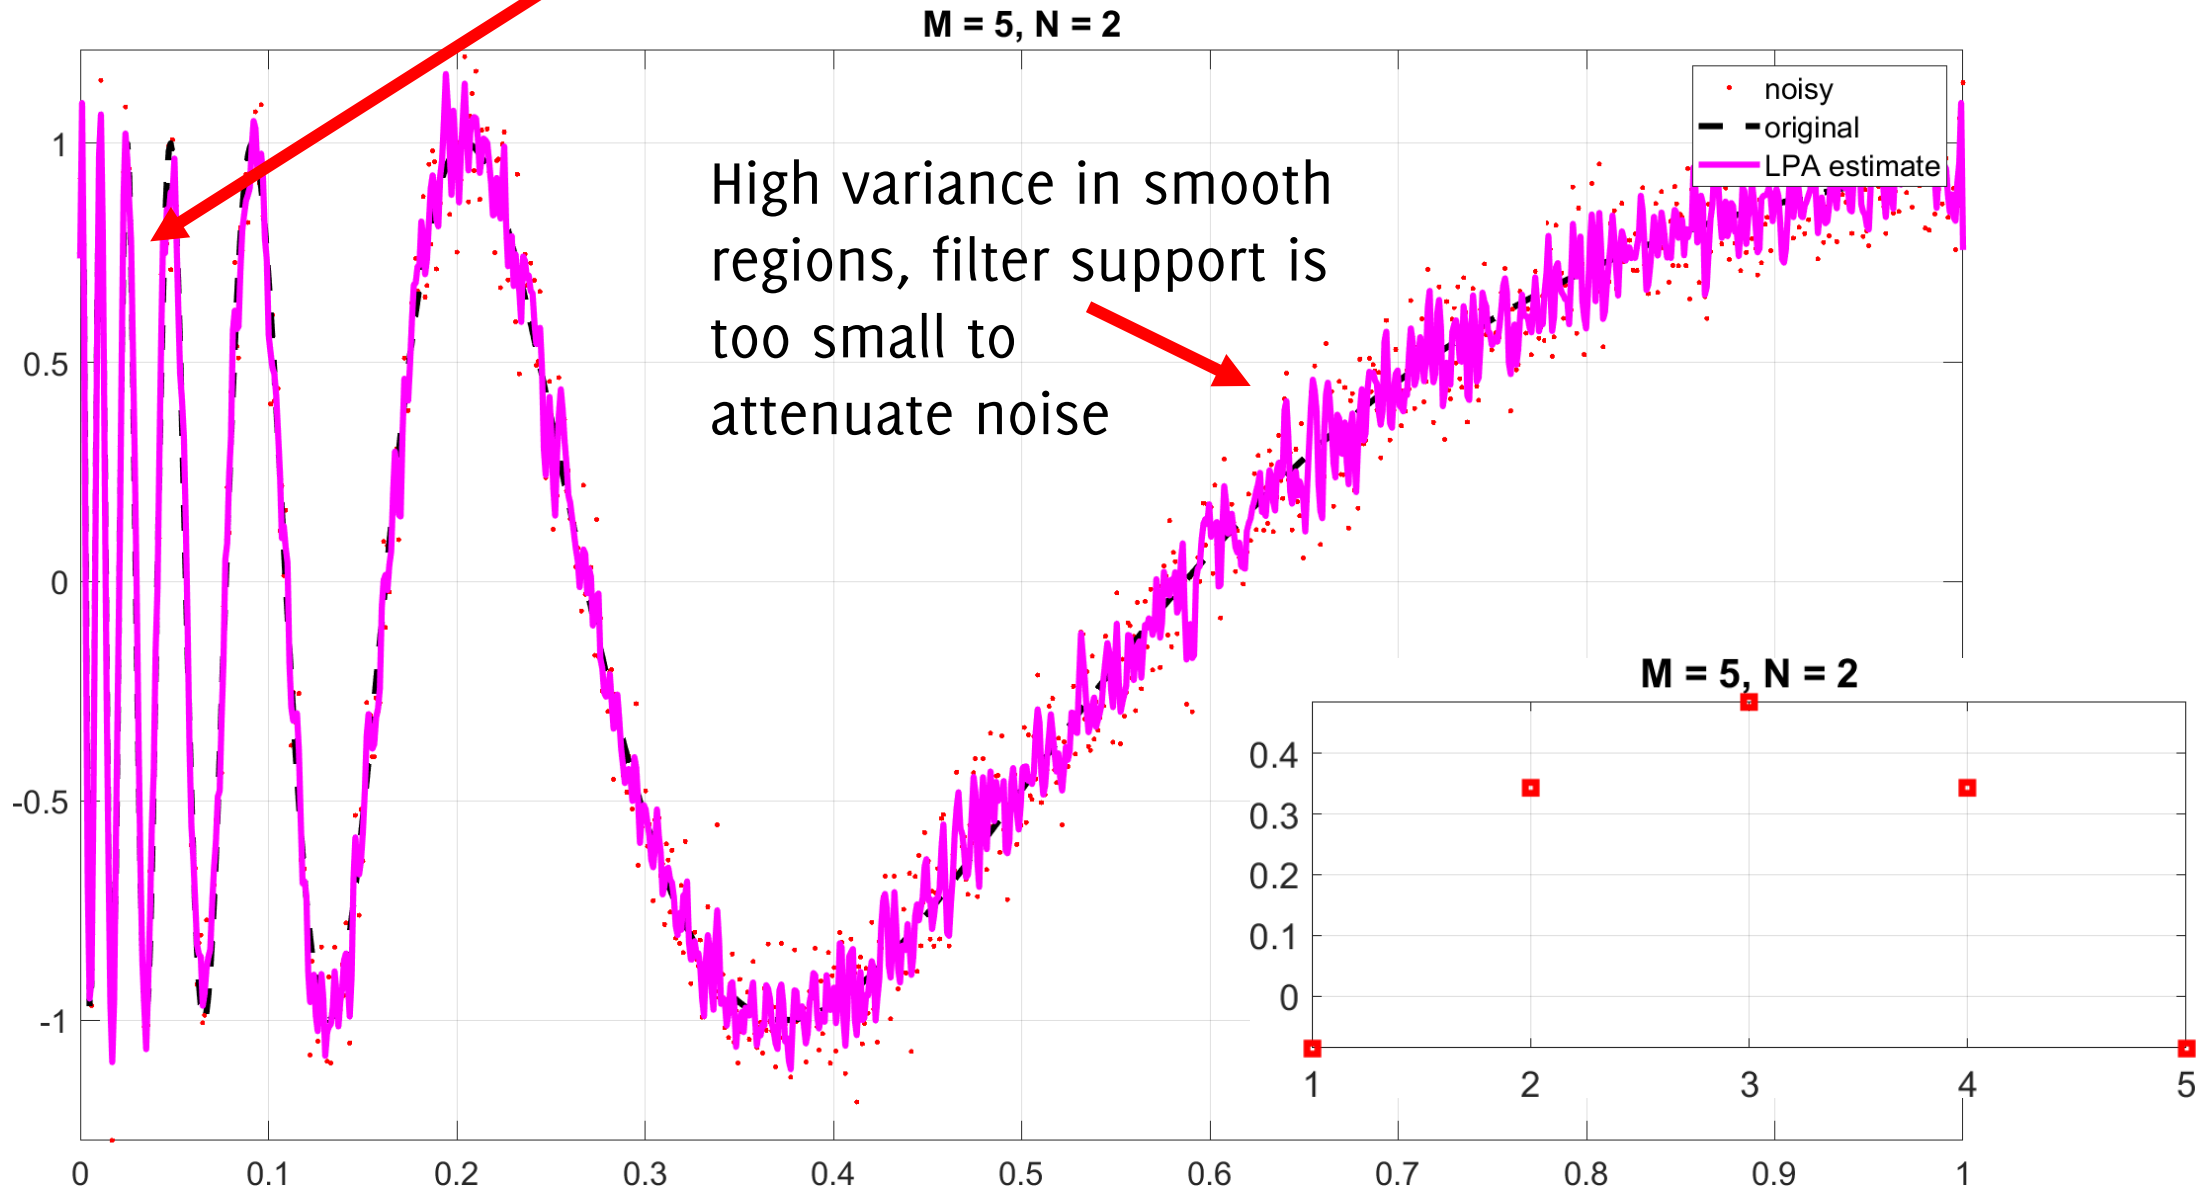

Large M , large N

Lower bias than before when the signal frequency is high

small M , small N

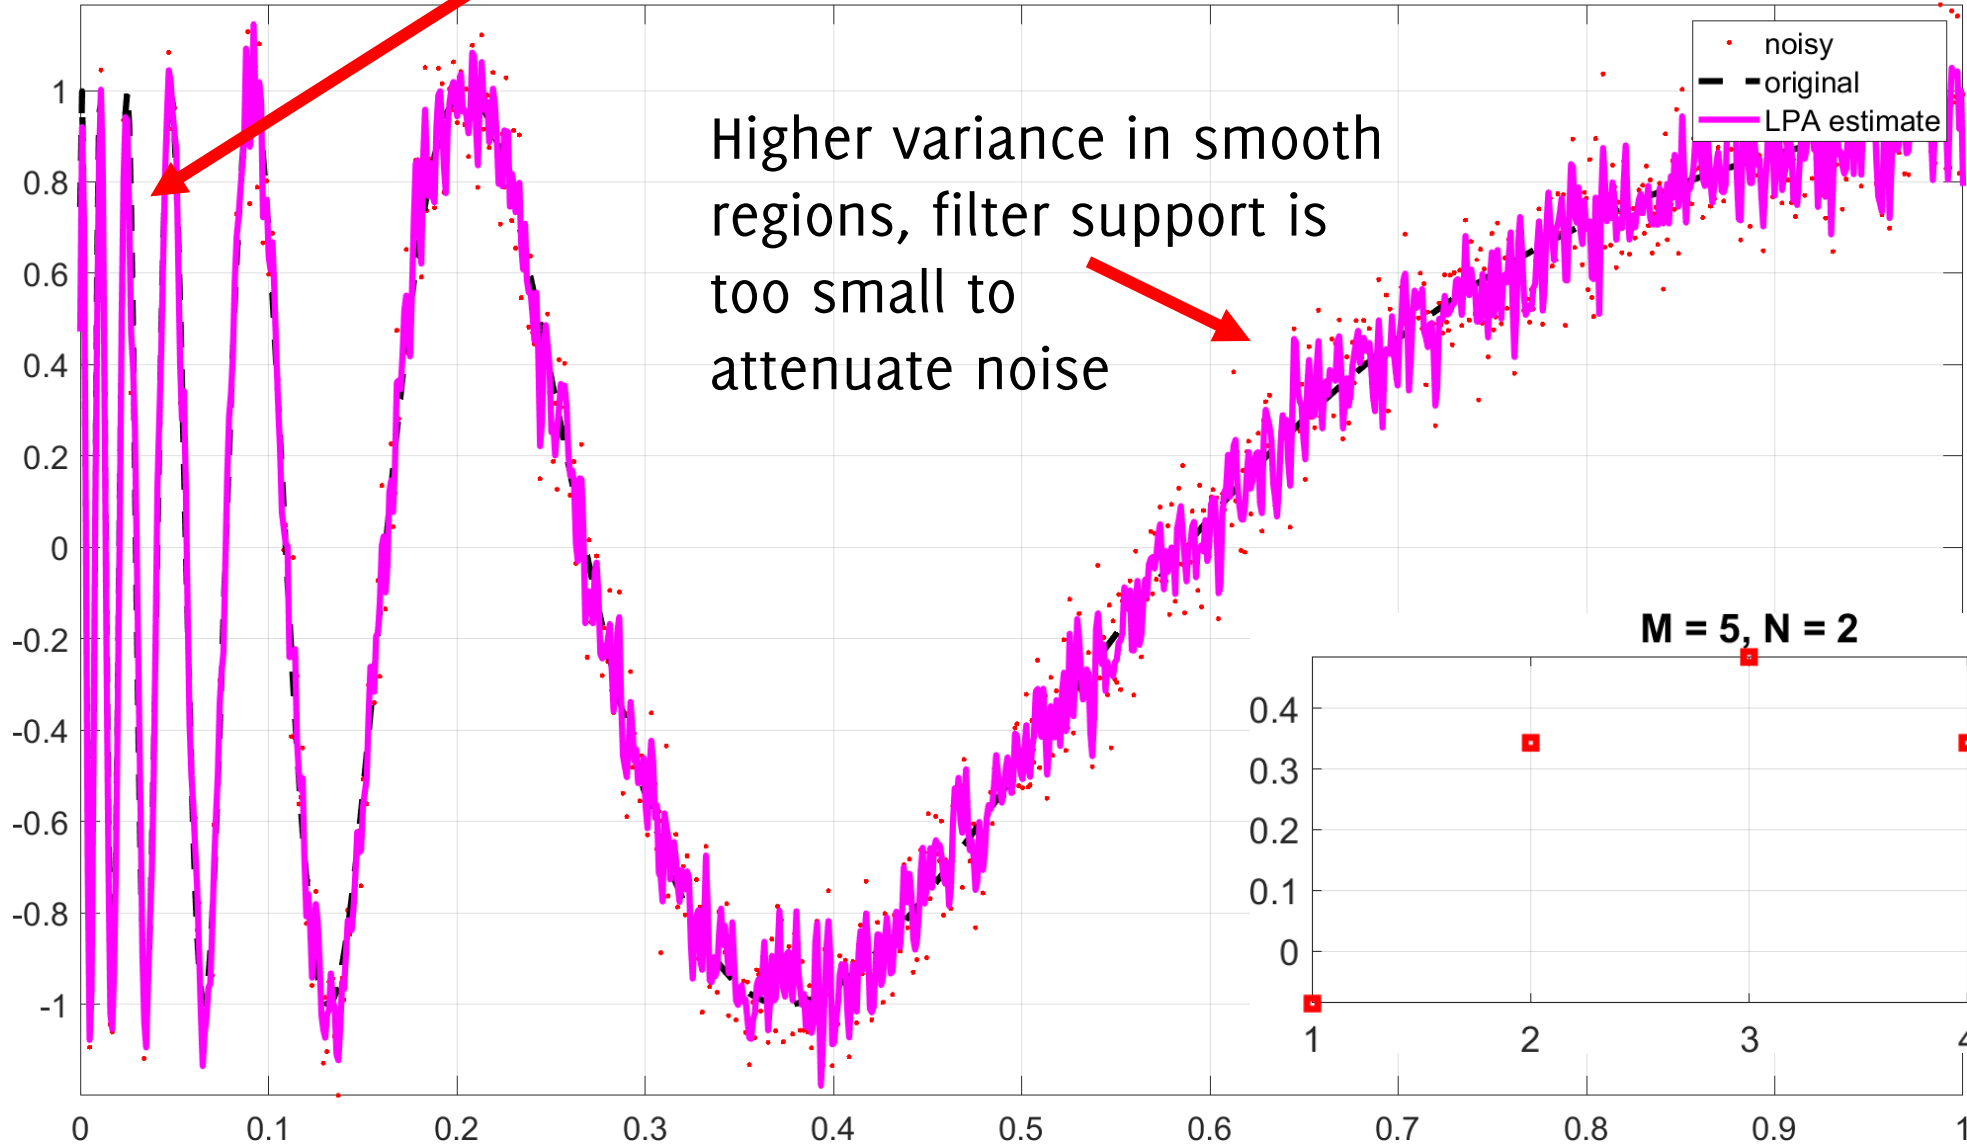

Lower bias than before when the signal frequency is high

small M , comparable N

Lower bias than before when the signal frequency is high

$M = 7, N = 5$

Assignment 2: Weighted LPA Kernels

Lez21_B_weighted_LPA

Define the **weighted LPA** filters for a given polynomial order N and over a fixed support M to perform regression over noisy signals

Use binary weights to compute centered, left and right estimates. See how these behave w.r.t. signal discontinuities

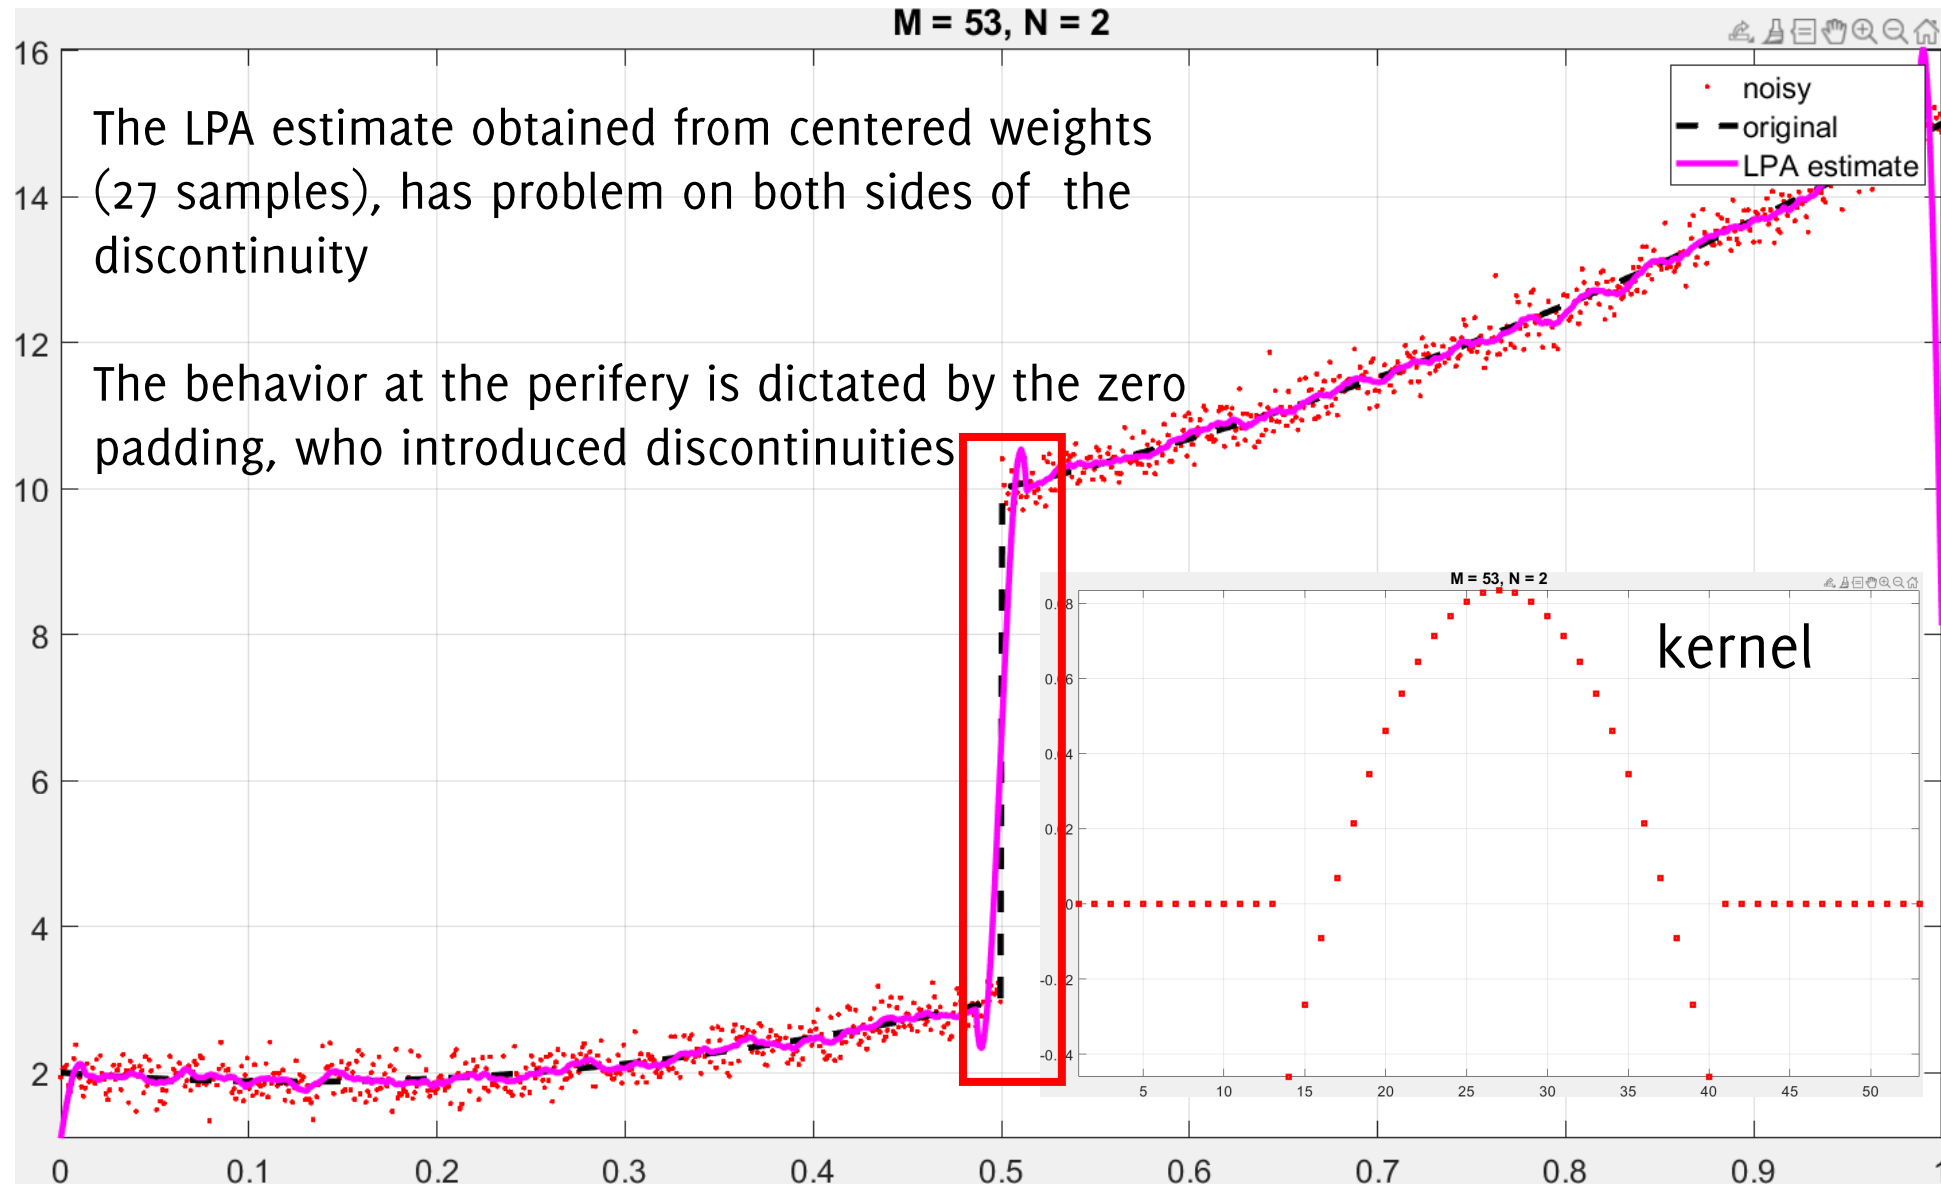

Example of binary weights to use

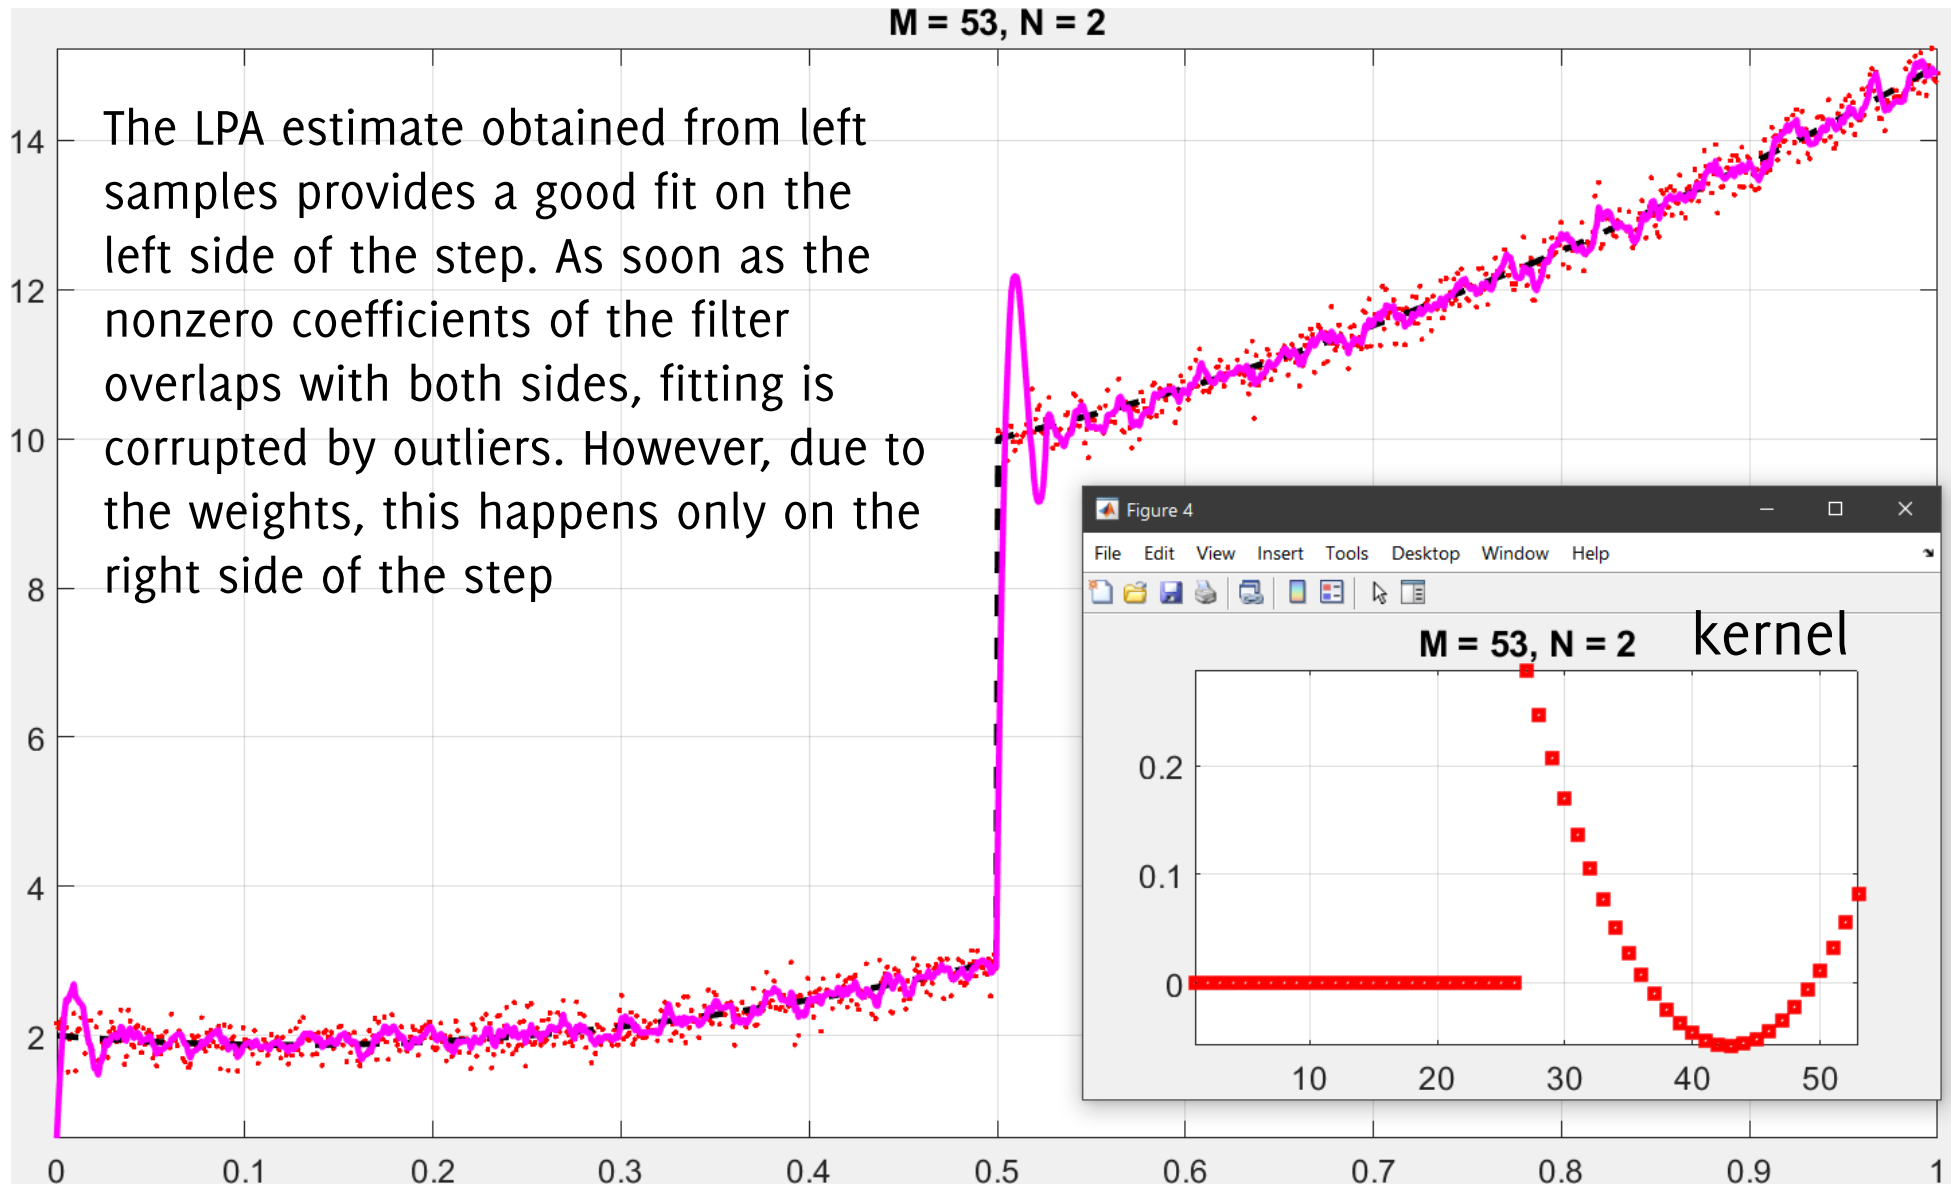

Handling Discontinuities

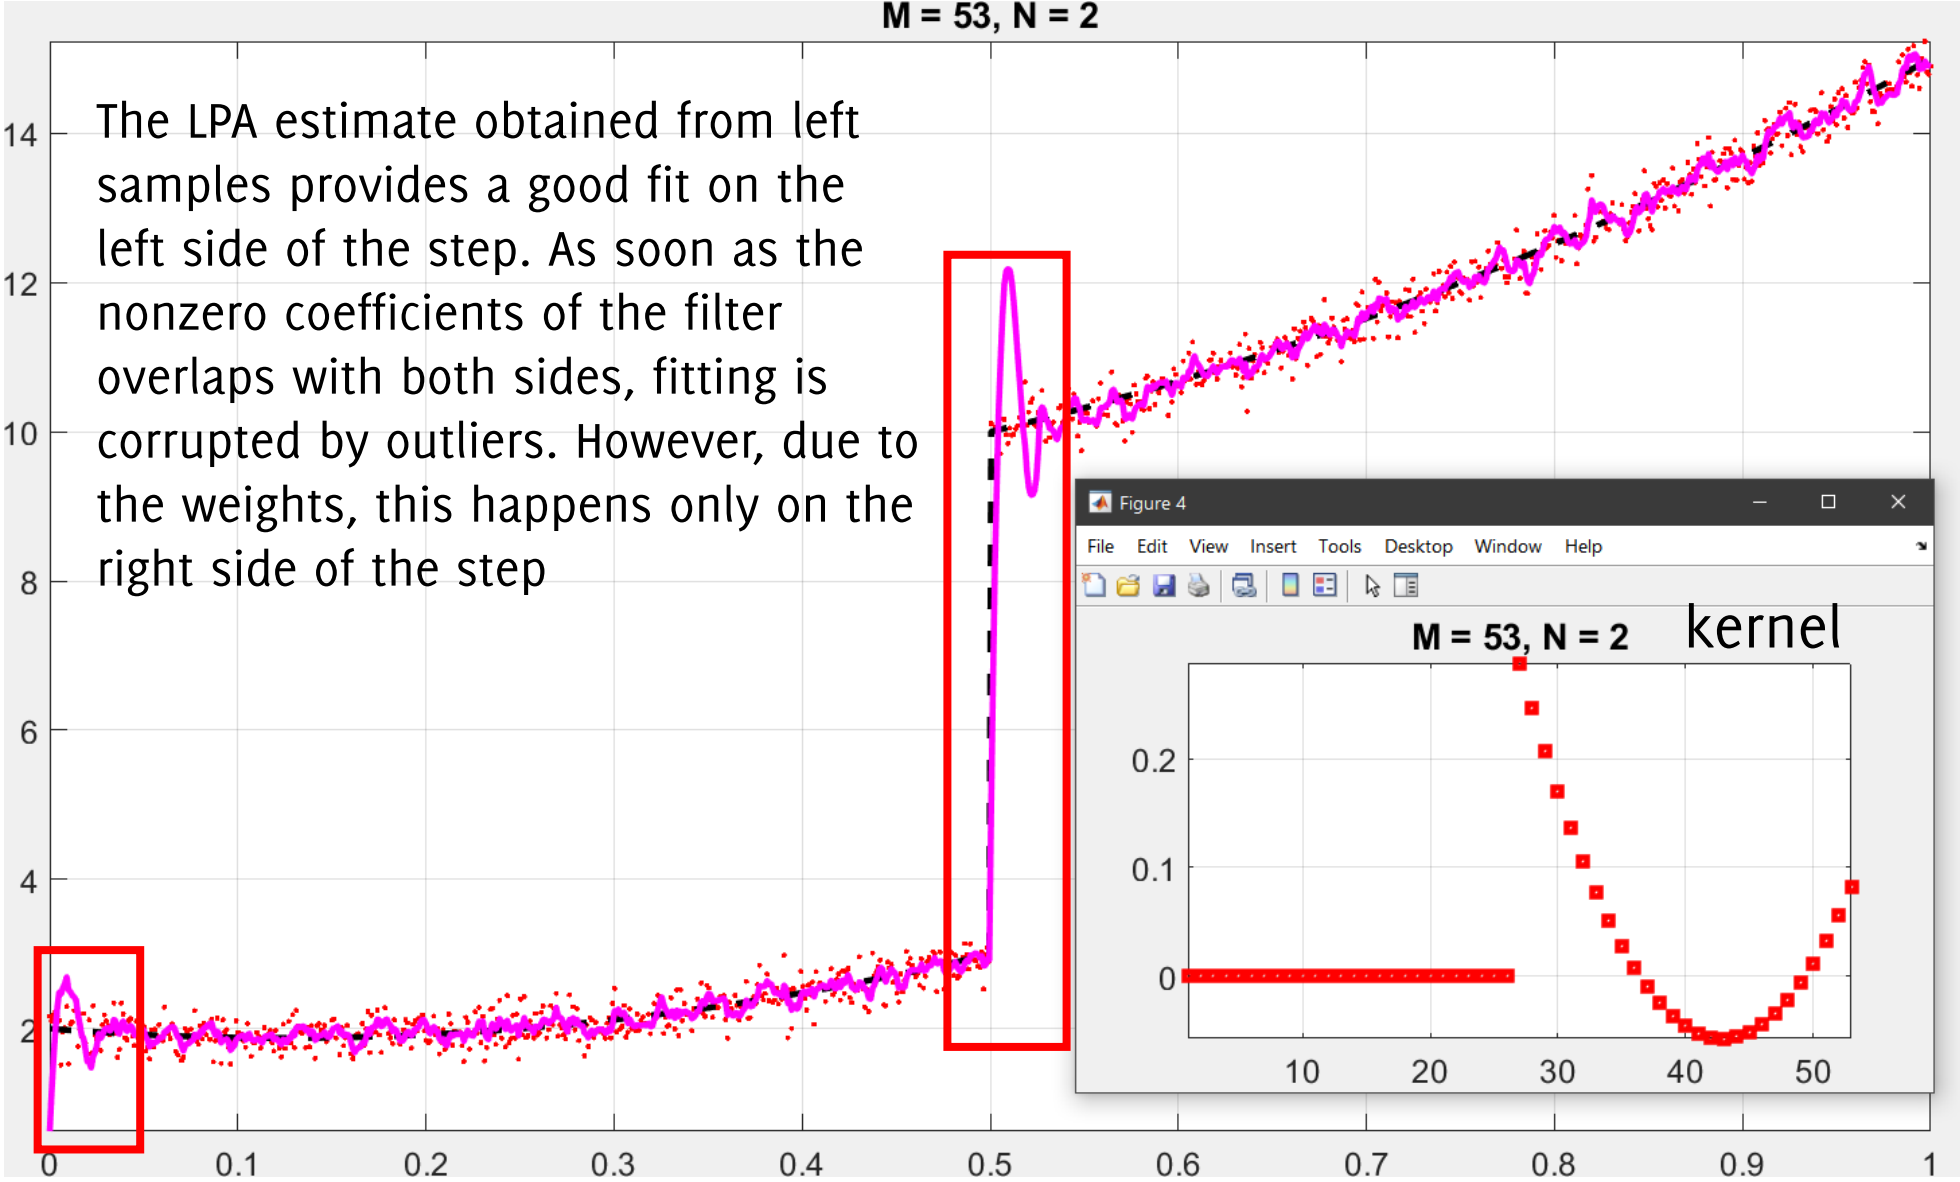

Handling Discontinuities: «centered weights»

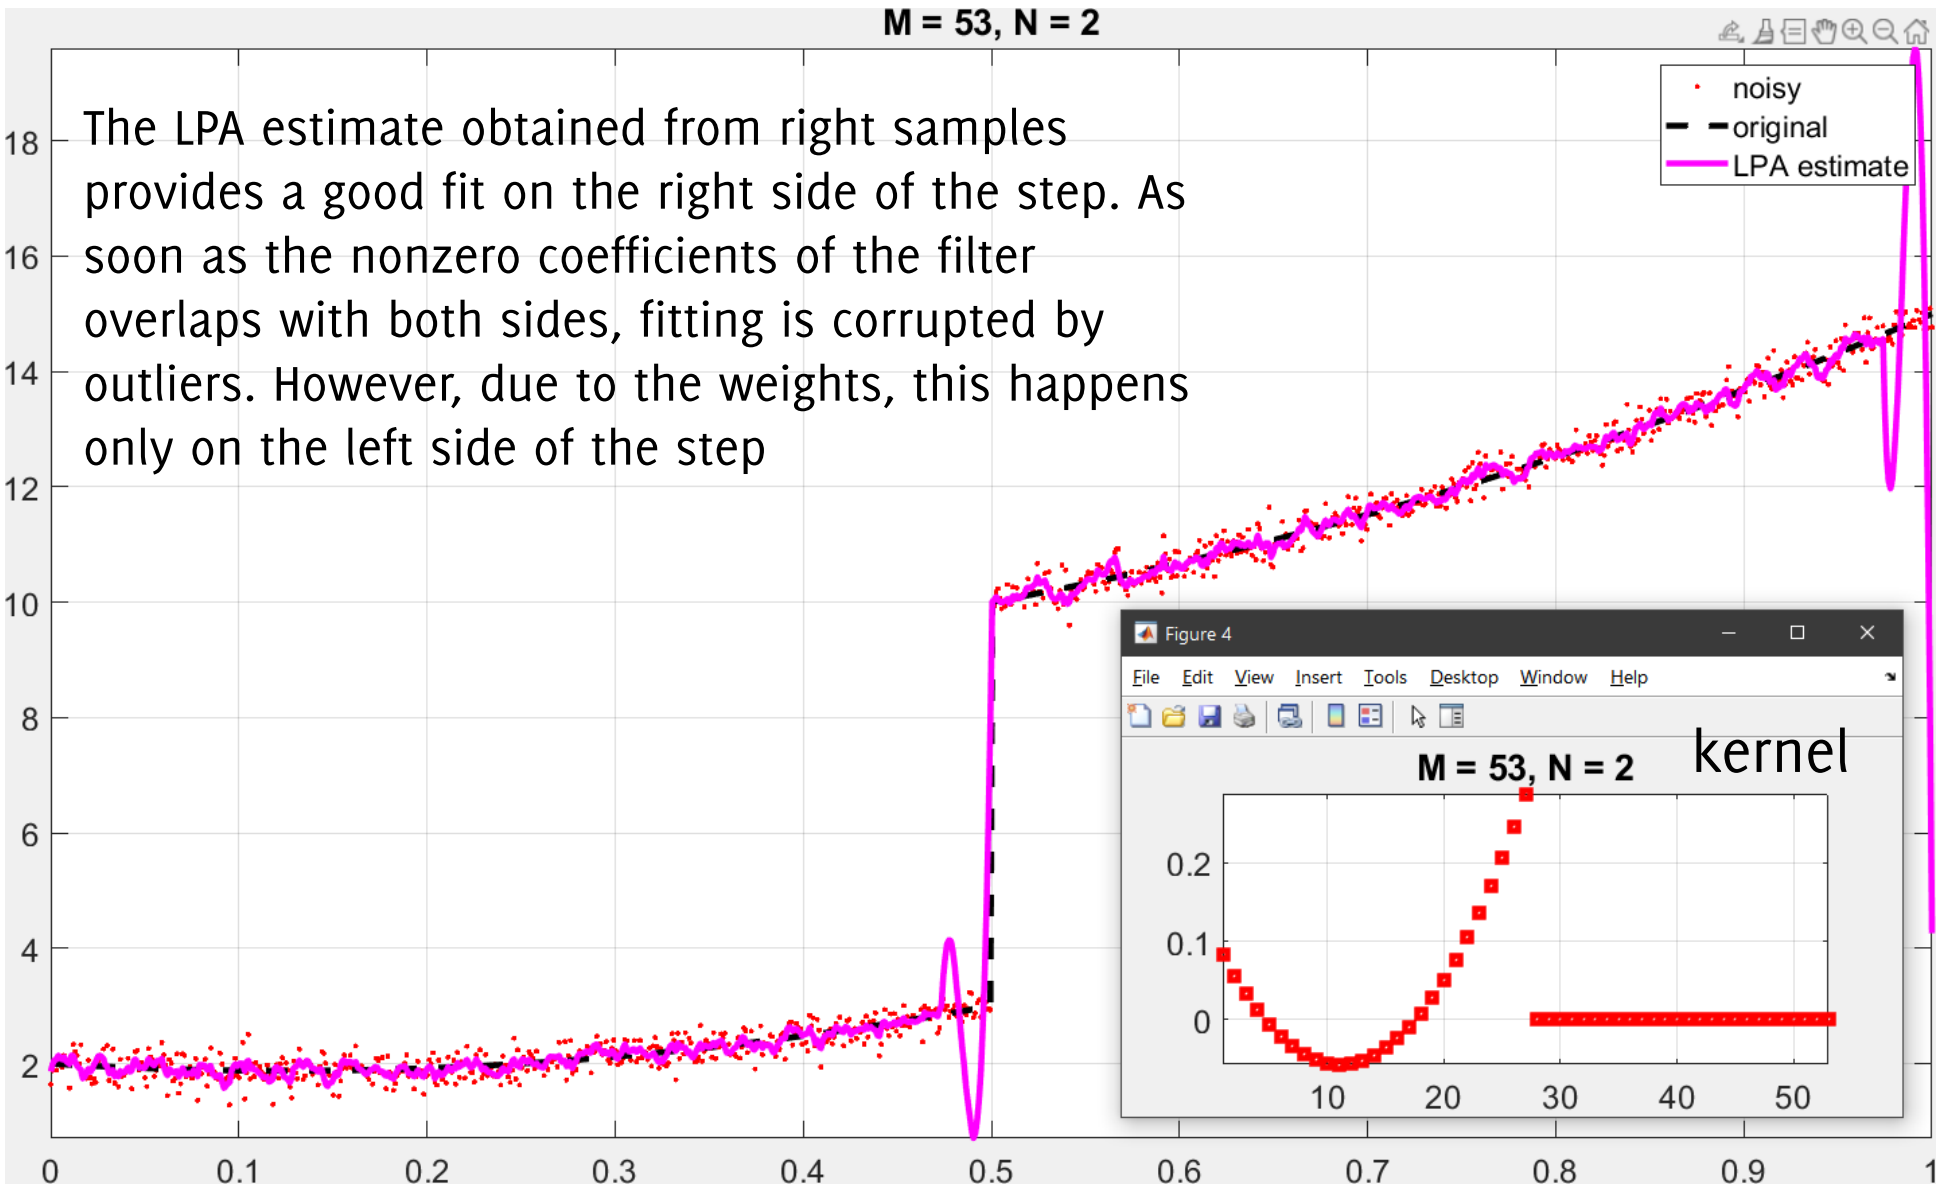

Handling Discontinuities: «left weights»

Handling Discontinuities: «left weights»

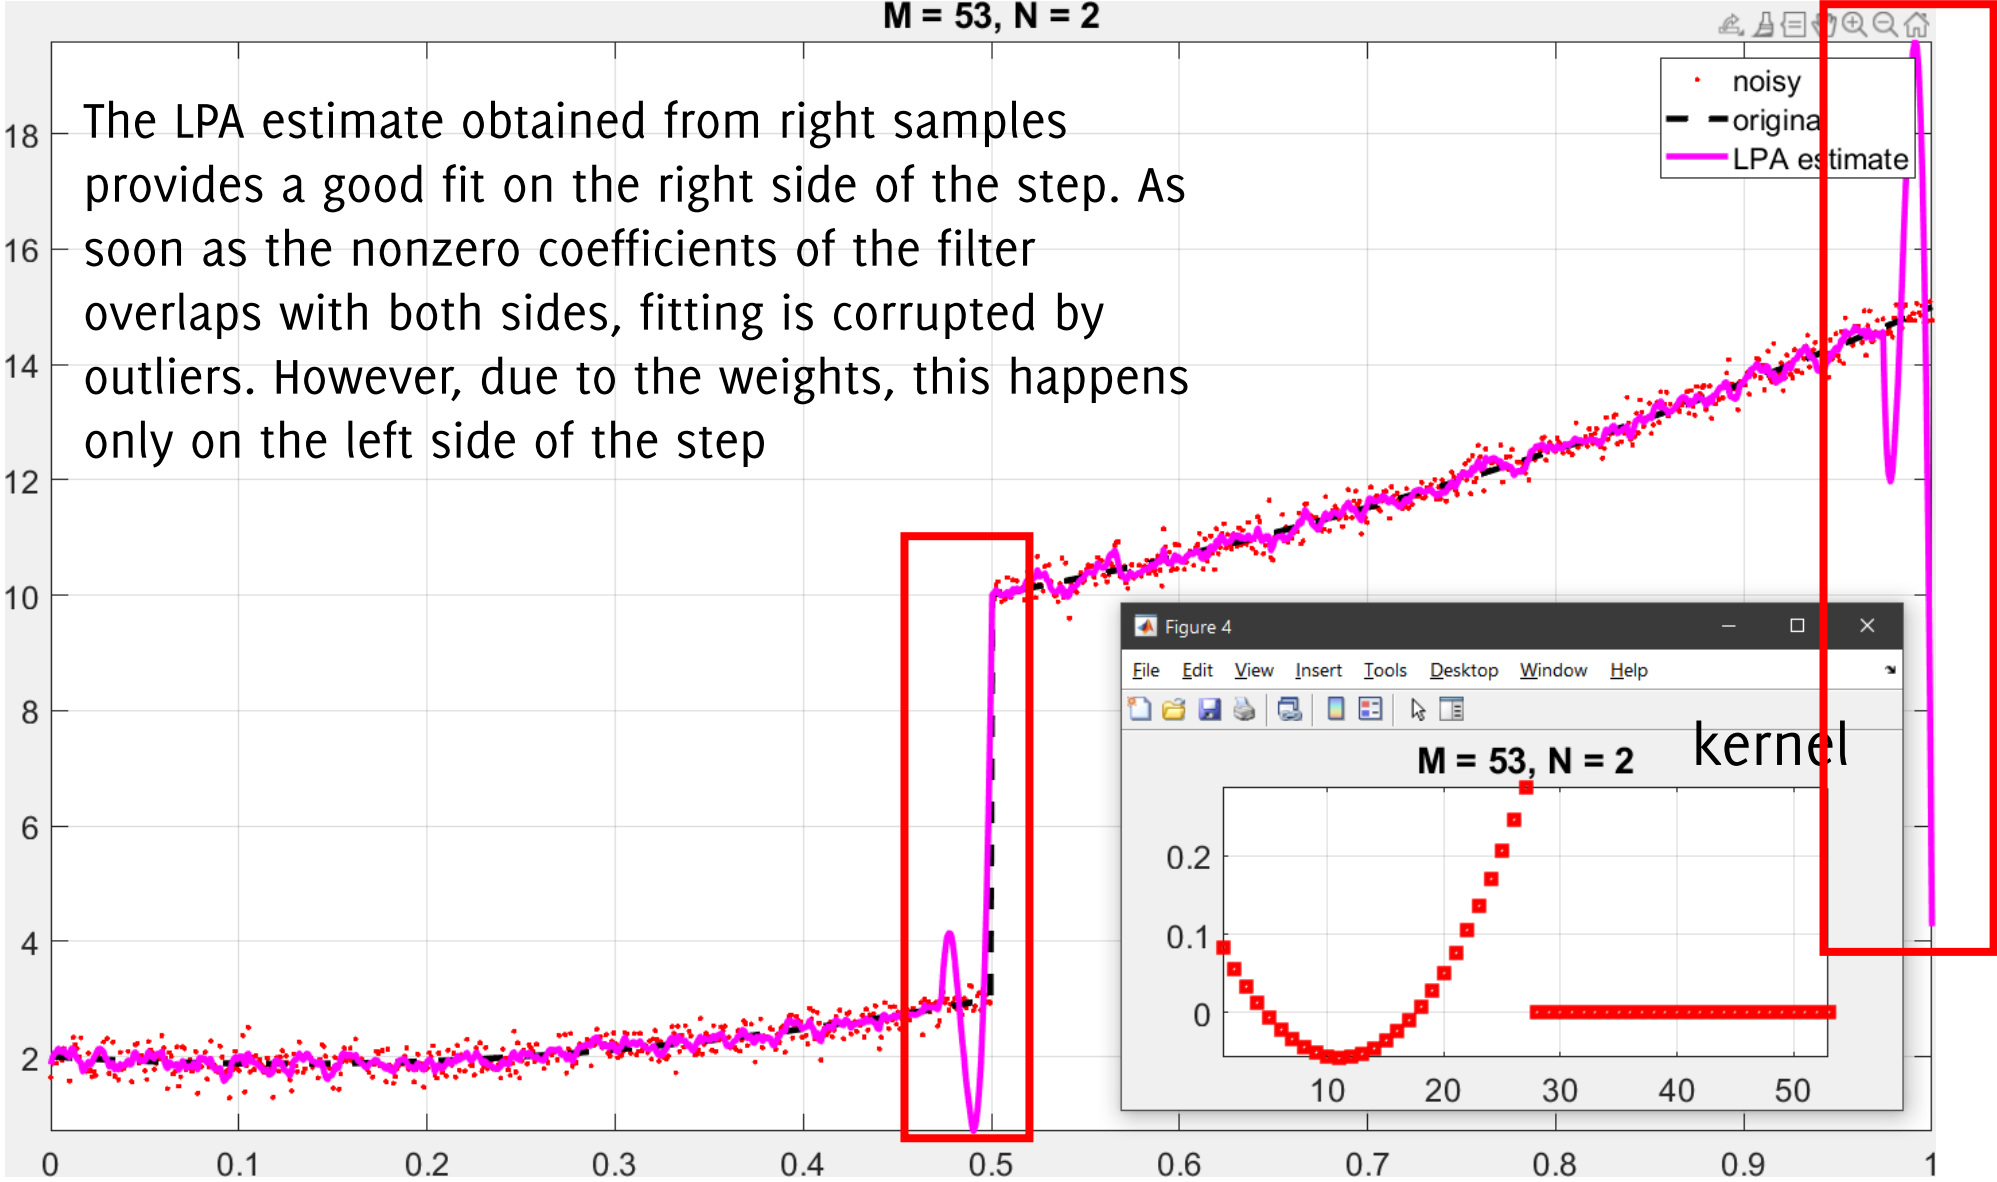

Handling Discontinuities: «right weights»

The LPA estimate obtained from right samples provides a good fit on the right side of the step. As soon as the nonzero coefficients of the filter overlaps with both sides, fitting is corrupted by outliers. However, due to the weights, this happens only on the left side of the step

Handling Discontinuities: «right weights»

The LPA estimate obtained from right samples provides a good fit on the right side of the step. As soon as the nonzero coefficients of the filter overlaps with both sides, fitting is corrupted by outliers. However, due to the weights, this happens only on the left side of the step

Handling Discontinuities: «right weights»
